## Module 1 DCA, standard S.ID. 6 Review

1) The table the population for a small town for each year from 2003 to 2010.

| Year | 2003 | 2004 | 2005 | 2006 | 2007 | 2008 | 2009 | 2010 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Population | 21,359 | 22,906 | 22,542 | 23,048 | 23,562 | 23,609 | 24,008 | 24,716 |

a. Let $x$ represent the years since 2003. Use Desmos.com to determine a linear regression equation for the data. Round the slope and $y$-intercept to the nearest whole number.

Equation: $\qquad$
b. Predict the population in 2020. Show your work, and explain your reasoning.

Answer: $\qquad$ Work:

Explanation:
2) Gandalf and Galadriel each drew a regression line to model a set of data. They both recorded the vertical distances between each point and the regression line. Both students believe they drew the least square regression line. Who is correct? Justify your choice.

Gandalf's vertical distances: $2,3,3,3,4$
Galadriel's vertical distances: 1, 2, 2, 3, 7

Who is correct?
Why?

## Module 1 DCA, standard S.ID. 6 Review, page 2

3) The weekly sales of an album have increased since it was first sold at a music store 6 weeks ago. The linear regression equation describing the change is $y=1.9 x+13.3$, where x represents the week and $y$ represents the number of albums sold per week.
a. Complete the table to determine the residuals for the number of albums sold per week. Do not round your answers. Show your work.

| Week | Number of <br> Albums Sold | Predicted Number of <br> Albums Sold | Residual Value |
| :---: | :---: | :---: | :---: |
| 0 | 13 |  |  |
| 1 | 16 |  |  |
| 2 | 17 |  |  |
| 3 | 18 |  |  |
| 4 | 21 |  |  |
| 5 | 23 |  |  |

## b. Construct a residual plot of the data.
